Presentation/Paper Type: Oral / Abstract

Abstract- The sun's rays, which are our source of life, give us pleasure to enjoy in the winter and spring, but in the summer, the steep and scorching rays disturb us all. For this reason, it is observed that on average, 52% of the cooling load needed in the calculations for cooling a summer house with air conditioning is caused by glass heat gain.

Zippered curtain works like a motorized roller shutter system, but its main components are aluminum, motor and technical textile fabric. This product is specially designed to protect a place from excessive heat of the sun, from the wind, from the cold and to create an ideal indoor climate.

The zippered curtain system helps to prevent overheating by preventing undesired heat from entering on the one hand while ensuring optimum light and heat penetration while protecting the home from damage by reducing the effect of wind in winter months.

This saves a great deal of savings on cooling and heating in summer and heating in winter.

Keywords- Zippered curtain, technical textile, cooling system, energy
